SARS-CoV-2 (PCR-RT)

Run by BS on 12/3/2021 2:41:00 PM

This test is a real-time reverse transcription polymerase chain reaction (RT-PCR) test intended for the qualitative detection of nucleic acid from SARS-CoV-2 in upper respiratory specimens. This test has been authorized by the FDA under an Emergency Use Authorization (EUA). Testing is limited to laboratories certified under the Clinical Laboratory Improvement Amendments (CLIA).

If you have a positive test result, it is very likely that you have COVID-19. Therefore, it is also likely that you may be placed in isolation to avoid spreading the virus to others. Your healthcare provider will work with you to determine how to best care for you based on the test results, along with your medical history and symptoms.

A negative test result means the virus was not found in your sample. Negative results do not preclude SARS-CoV-2 infection and should not be used as the sole basis for patient management decisions. Negative results must be combined with clinical observations, patient history, possible exposures and geographical locations of places you have recently traveled.

You can review the "FAQ Sheet" for health care providers and patients on our website at <https://www.precisionlabaz.com>

If the findings do not fit the clinical picture, please submit a new sample.
